

Introduction to Computational Psychiatry

Klaas Enno Stephan

Translational Neuromodeling Unit

Universität
Zürich^{UZH}

Eidgenössische Technische Hochschule Zürich
Swiss Federal Institute of Technology Zurich

From differential diagnosis to nosology

SYMPTOM

MECHANISMS
(pathophysiology)

CAUSES
(aetiology)

>3,000 FDA-approved clinical tests in medicine

1 diagnostic instrument in psychiatry

Diagnostic and Statistical Manual of Mental Disorders (DSM)

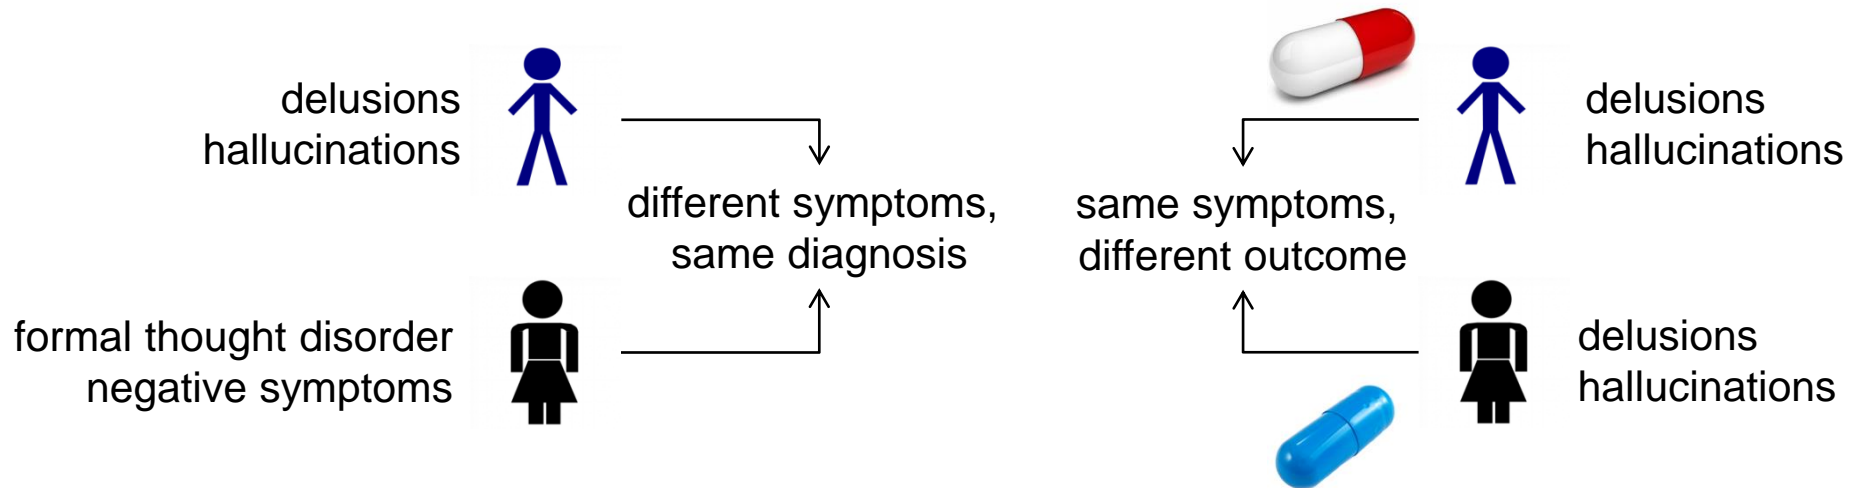

DSM IV: Schizophrenia

- Delusions
- Hallucinations
- Formal thought disorder
- Grossly disorganized or catatonic behavior
- Negative symptoms: flat affect, anhedonia, avolition, alogia, asociality

≥ 2 symptoms
over ≥ 1 month

+ social or occupational dysfunction

+ continuous signs of the disturbance persist for at least six months

Psychiatric disorders = spectrum diseases

polygenetic basis
gene-environment interactions
environmental variation

**variability in clinical
trajectory and treatment
response**

multiple disease mechanisms

Molecular Psychiatry (2012) 17, 1174–1179

PERSPECTIVE

Why has it taken so long for biological psychiatry to develop clinical tests and what to do about it?

S Kapur¹, AG Phillips² and TR Insel³

**We often take DSM too seriously
(or forget about its original purpose).**

**Trying to develop clinical tests based on constructs which are
inherently heterogenous is not a promising strategy.**

Computational approaches to psychiatry

Klaas Enno Stephan^{1,2,3} and Christoph Mathys³

Computational psychiatry: the brain as a phantastic organ

Karl J Friston, Klaas Enno Stephan, Read Montague, Raymond J Dolan

Computational Psychiatry

Xiao-Jing Wang^{1,2,3,*} and John H. Krystal^{3,4,5,6}

Translational Perspectives for Computational Neuroimaging

Klaas E. Stephan,^{1,2,3,*} Sandra Iglesias,¹ Jakob Heinzle,¹ and Andreea O. Diaconescu¹

Computational Psychiatry: towards a mathematically
informed understanding of mental illness

Rick A Adams,^{1,2} Quentin J M Huys,^{3,4} Jonathan P Roiser¹

Computational psychiatry as a bridge from
neuroscience to clinical applications

Quentin J M Huys^{1,2,5}, Tiago V Maia^{3,5} & Michael J Frank⁴

What exactly do we mean by "computational"?

- in **computer science**:
 - “computation” = a well-defined process (algorithm) that transforms an input set into an output set in a finite number of steps
- in **neuroscience**: two common usages
 - *methodological approach*
 - investigations of neural or cognitive systems by algorithmic, as opposed to analytical, approaches
→ “computational neuroscience”
 - *information processing* (Marr's “algorithmic level”)
 - as opposed to physiological implementation

A taxonomy of computational clinical neuroscience

Understanding how/what
the brain computes

Develops/validates
mathematical models for
solving clinical problems

Application within
specific medical fields

1 Computational assays: Models of disease mechanisms

A clinical neuromodeling strategy

2 Application to brain activity and behaviour of individual patients

3 Detecting physiological subgroups (based on inferred mechanisms)

- disease mechanism A
- disease mechanism B
- disease mechanism C

4 Individual treatment prediction

Generative models as "computational assays"

$$\begin{aligned} & \xleftarrow{p(y | \theta, m) \cdot p(\theta | m)} \\ & \xrightarrow{p(\theta | y, m)} \end{aligned}$$

$$\begin{aligned} & \xleftarrow{p(y | \theta, m) \cdot p(\theta | m)} \\ & \xrightarrow{p(\theta | y, m)} \end{aligned}$$

Computational assays: key clinical questions

SYMPTOMS

(behavioural or physiological data)

MECHANISMS

(computational, physiological)

CAUSES

(aetiology)

differential diagnosis
of alternative disease
mechanisms

spectrum dissection
into mechanistically
distinct subgroups

prediction of clinical
trajectories and
treatment response

Differential diagnosis by model selection

Synaesthesia

- “projectors” experience color externally colocalized with a presented grapheme
- “associators” report an internally evoked association
- Bayesian model selection of competing DCMs separates projectors (bottom-up mechanisms) and associators (top-down)

Generative embedding (unsupervised)

Detecting subgroups of patients in schizophrenia

Optimal
cluster
solution

- three distinct subgroups (total N=41)
- subgroups differ ($p < 0.05$) wrt. negative symptoms on the *positive and negative symptom scale* (PANSS)

Generative embedding (supervised)

Predicting future drug abuse

- fMRI of 157 occasional stimulant users (stop-signal task), Bayesian hidden Markov model
- prediction error (PE) activity from several brain regions predicted problem use 3 years later
- model-based prediction (sensitivity 62%, specificity 83%) outperformed predictions based on clinical variables and conventional fMRI analyses

UPE = unsigned PE
SPE = signed PE

Key challenges for CP/TN (and our local response)

- 1. Highly interdisciplinary → mutual teaching**
- 2. Methodology in its infancy → open source code and data sharing**
- 3. Prospective validation studies → uniting computational & biomedical scientists in new types of organisations**

Key challenges for CP/TN (and our local response)

CPC 2017

COMPUTATIONALPSYCHIATRYCOURSE

- 3rd international edition
- originated from our local courses on Computational Psychiatry since 2012
- key features
 - theoretical lectures & practical demonstrations coupled
 - open source software only
 - covers models of both physiology and behaviour
 - 26 international presenters from 17 different institutions

CPC 2017

COMPUTATIONALPSYCHIATRYCOURSE

DAY 1

Psychiatry

DAY 2

Bayesian Inference &
Machine Learning

DAY 3

Models of
Planning &
Decision Making

DAY 4

Biophysical Models &
Model Inversion

DAY 5

Computational
Psychiatry Applied
